

New Kid in Town

Meet the 3R60-PRO

Smaller, thinner and lighter, the new addition to the 3R60 EBS family keeps up with its sibling and is even 10% shorter.

It's all in the genes. The 3R60-PRO features a movable proximal pyramid adapter (10 mm anterior/posterior) that makes alignment optimization quick and easy. The PRO's name refers to its ability to deliver progressive levels of stance flexion depending on the user's gait. Faster, more aggressive steps are damped more while slower, less aggressive steps are damped less.

For the smaller-framed patient — 165 lbs/75 kg or less and in K3/K4 activity levels — this knee offers the ultimate in performance.
