

"My braces keep me mobile and help straighten my posture."

TROY'S PATIENT INSPIRED SOLUTION

Ultraflex addresses the multiple treatment goals associated with Camurati-Engelmann Disease (CED), a rare disease, characterized by proximal muscle weakness, a wide-based, waddling gait, and joint contractures. Ultraflex stretching KOs (worn at rest) are being used bilaterally to maintain passive range of motion. Since wearing his stretching KOs, Troy has noticed that the tightness in his legs has lessened and that he can stand straighter. Ultraflex Adjustable Dynamic Response™ (ADR™) AFOs (daytime) are worn bilaterally to augment muscles, provide normal range, increase stability, and improve posture/balance. With his ADR™ braces, Troy is able to walk to his classes at school without an additional mobility device. Troy's mom reports, "Troy's braces enable him to stand for a long period of time and to walk. Without his braces he is unable to walk."
